## VEHICLE PAINT DETAILING

PDF download information sheet: V2.1

### **Detailing**

Detailing involves cleaning and bringing a shine to the car's paintwork, wheels, and tyres. This is achieved using different products including detergents, detail clay, waxes, polishes and a variety of applicators and microfibre cloths.

### **Cleaning**

Cleaning includes the removal of all foreign surface particles from exterior surfaces through the use of washing and claying. A clay bar helps to clean contamination/dirt from within the clear coat that cannot be removed through weekly washing such as insects, tar, sap, etc.

### **Correcting**

Correcting refers to the use of mechanical polishes with a machine and specific polishing pads that remove microns of clear coat from a vehicle, thus removing fine scratches and swirls from a paint surface. This is carried out by re-levelling the lacquer by 1 or 2 microns, so that the paintwork reflects light perfectly at all angles, including direct sunlight.

### **Protecting**

Protecting involves the application of a protective wax that prevents foreign matter from adhering to the surface of the vehicle, including water, insects splatter, tar, and dirt. Waxes and sealants provide this barrier against the elements. Waxes are some of the most expensive elements of the detailing process.
